## ABSTRACT

Fresh fruit consumption plays significant role in Thailand economy. Despite being one of the best origins for growing agricultural fresh produce, Thailand has been importing a lot of fresh fruits from other origins, particularly those varieties that are not available domestically due to climatic and geographical limitation.

Fresh fruits have always been perceived as commodity products, which means the price is purely driven by market or demand and supply situation. Consumers usually choose which products or brands to buy based solely on physical appearance.

However, due to the more widened information access across the globe, consumers have been changing. Their concerns about quality, safety and nutritional value of fresh fruits have been raised tremendously. Instead of looking only at the appearance, they also want to know how the fruits were grown, harvest, stored and packed.

To address the changing demand of consumer, fresh fruit producers began to implement marketing and branding on their products. Example of successful

producers is Dole and Del Monte, which are worldwide recognizable due to their presence in several product categories and countries.

This study aims to understand the factor or attribute influencing imported fresh fruit purchasing decision, particularly factor driven by brands and marketing. Data will be collected mainly by in-depth interview and survey questionnaire. The collected data will then be analyzed by SPSS. The research period is from October 1, 2017 to March 31, 2018.

**Keywords:** Fresh fruits, Fresh produce, Commodity

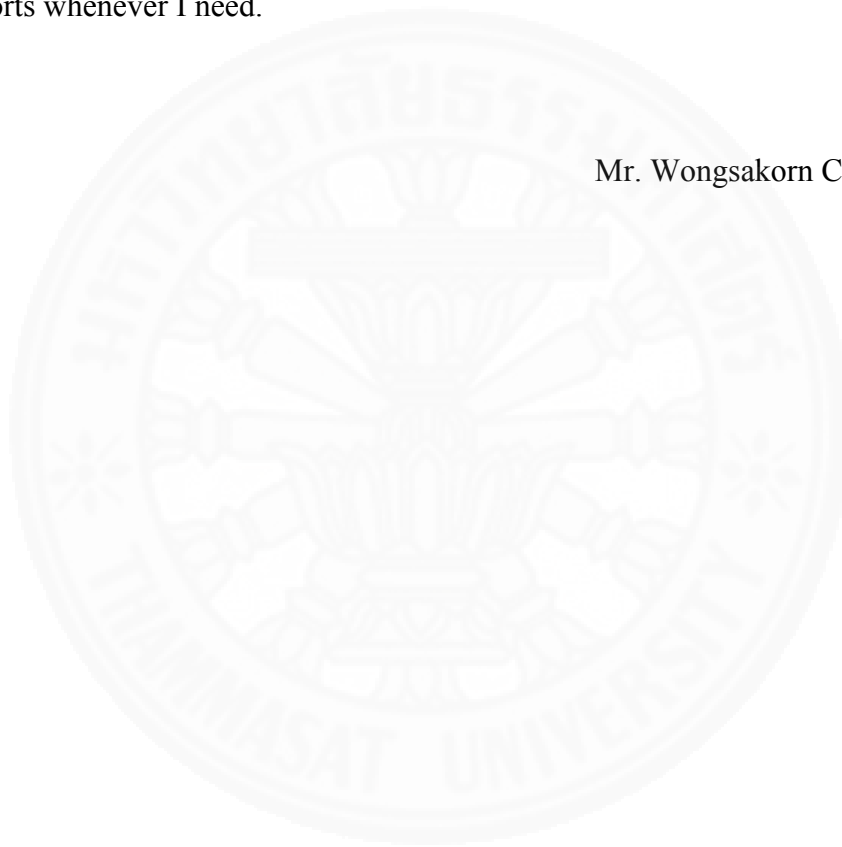

## ACKNOWLEDGEMENTS

I would like to express my sincerer gratitude to my advisor, Professor K. Douglas Hoffman, Ph.D. for his advice and support throughout the duration of this independent study. His time and effort are highly appreciated.

In addition, I would like to thank all respondents who provide information for the research. Last but not least, I would like to also thank my friends who gave me supports whenever I need.

Mr. Wongsakorn Chatamornwong

## CHAPTER 1

### INTRODUCTION

#### 1.1 Current Situation

*Definition:*

***Imported fresh produce:*** *Fruits and vegetables that are grown in other countries than Thailand and are brought into the country through importation.*

Traditionally, there were no distinct characteristics among each kind of fruit. Consumers made purchasing decision mainly on the freshness and appearance of fruits. Marketing and branding received little attention. One of the main reasons to explain this fact is that fresh fruit has high perishability. However, in recent years, fresh fruit marketing has gained more interest. Many international producers of fresh fruits from several origins emphasized more on branding fresh fruits to not only create awareness, but also pointing out its unique selling points in order to differentiate the brand from the rest in the industry.

Thailand has imported fresh fruits from other origins for several decades. In 2016 total imported fruits value into Thailand hits 683 million USD growing 10% from last year. The number is expected to grow even further in 2017. This represents 25% of total fresh fruits consumption, which is significant number considering how big the local production of fresh fruit in Thailand is (The International Trade Administration (ITA), U.S. Department of Commerce., 2017). In addition, the import tariff on fresh fruits from several origins have been reduced or waived through Government free trade agreement with many producing countries, which make fresh imported fruit more affordable to Thai consumers.

## 1.2 Research Objectives

### **1. To explore influence of branding on consumer attitude and belief toward imported fresh fruits**

- To understand customer's decision making process from awareness to purchase both from consumer and reseller's point of view
- To explore difference between of attitude and belief among difference segment of consumers

### **2. To determine key attributes in imported fresh produces that Thai consumers look for and their level of importance**

- To identify benefits that consumers look for
- To establish marketing mix that are important to customers

### **3. To identify key elements for effective communication**

- To specify appropriate media for targeted customer segments
- To identify location and channel for promoting

This study helps to indicate an opportunity to apply marketing knowledge to enhance business in imported fresh produce industry in Thailand, which is commoditized industry, lacks apparent differentiation and driven almost purely by market price. The result from the study will provide consumer insight regarding perception on imported fresh produces, which will be useful for establishing business and marketing plan.

## CHAPTER 2

### REVIEW OF LITERATURE

#### **2.1 Fresh Fruit Consumption in Asia-Pacific region**

Fresh fruit consumption has been the second most prominent food consumption in Asia-Pacific region after Vegetable with 22% share of the total food consumption. Despite not being the largest type of food consumed in the region, the growth of spending on fresh fruits has been between 9% and 16% across 2009 to 2014, outnumbered spending on other food, meat and particularly vegetable by fair margin. (Kocheri, 2015)

In fact, Asia Pacific region play significant role in global fresh fruit market. In 2015, the region accounted for 68% of total consumption. One of main drivers for this is the growth of emerging market such as China, India and ASEAN countries. The total fresh fruit consumption in Thailand is 10 megatons in 2015 with period growth rate between 2010 and 2015 at 12%. Two of the top performing fruits that contributed to the regional growth are blueberries and cherries. During 2010 to 2015, blueberries and cherries consumption in Thailand have cumulative annual growth rate of 8% and 9% respectively (Malhotra R. , 2017)

It is forecasted that urban consumers, working women and singles in Asia Pacific will continue to grow. These groups have common traits of being time-constrained, and looking for convenience. Apart from these three segments, aging consumers are also expected to grow and become significant fraction of population. The portion of Thai aging population in 2015 was 15%, but is forecasted to be over 23% in 2025. This presents an opportunity for fresh fruits market as aging consumers usually look for nutritious food. Producers should not overlook the fact that aging consumers become more dependent on family members. Small detail such as easy-to-understand packaging label will be important attribute for this particular group of consumer as well. Another opportunity that lies in this region is from the concern of obesity. The portion of overweight population in most countries in the region has been increasing. For Thailand in specific, overweight population is expected to exceed 30% of total population by 2025. It is observed that the potential cause of this problem is linked with the consumption of processed food, which is convenient, but usually

unhealthy. Fresh fruits producer can appeal this demographic segment by promoting healthy lifestyle and diet. (Malhotra, Fresh Fruits and Vegetables in Asia Pacific – Part 2, 2017)

## **2.2 Fresh Fruit Consumption in Thailand**

Thai consumers perceive wet market as the channel to buy fresher and more economical fresh fruits than those available at modern retail outlets. However, consumer-purchasing habits gradually change to cater modern retail sectors, particularly for those who live in urban areas, allowing modern retail outlets to have been expanding and becoming competitive counterpart to traditional wet markets. Thai consumers have higher confidence in safety, quality and health attributes of product purchased from supermarket and specialty store. These are the main factors that drive consumers to purchase from this channel. The study has also shown that decision to purchase fresh produce from modern retail outlets depends on household income and education of household leader. To keep up with competition, traditional retailers need to improve consumer convenience, expanding assortment of products offering and take on safety and quality standards for fresh fruits. On the other hand, modern retailers need to pursue premium segment to capture high-class consumers (Lippe, 2010)

With the changes in demographic and purchasing habit, it is predicted that Thai consumers will look for food with improved nutrition, in smaller packs, convenient yet healthy benefit. More importantly, they will also consider producers' ethics and transparency of how produce is grown and sourced. Globally big players in produce industry also address this emerging need from consumers by providing detailed information about source on the label. Furthermore, the retail sector has innovated and become more than just physical store, allowing consumer to shop from home and get the fresh produce delivered right at their doorstep. There are increasing number of home delivery retailers such as Honestbee, Happyfresh and Uber eats. The home delivery service literally brings retailers and growers closer to consumers. (Malhotra, Fresh Fruits & Vegetables in Asia Pacific – Part 3, 2017)

Despite having big national consumption of fruits already, Thailand still has enormous potential growth for fresh fruits consumption even further. According to

The Department of Health, Thailand, the minimum recommended intake of fruits and vegetables to reduce risks of cancer and heart disease is 400 grams per day. However, 82% of Thai consumers consume fruits and vegetables less than recommendations. So, there is the national plan to increase produce consumption which includes public relations on benefits of produce consumption, establishing consumer network specifically on produce consumption and new law and policy implementation that cater toward more household's produce consumption. The Department of Health also emphasize that consumer should consider buying reliable brand when it comes to fresh fruits and vegetable as product safety is big concern. (Tongkhao, 2014)

The establishment of free trade agreement between Thailand and many producing countries opens up the door for imported fresh produce to grow as it become more affordable to wider range of consumers. For example, in November 2015, Thailand and Chile entered into free trade agreement of various kinds of products, including agricultural products. The import tariff on fresh fruits was gradually reduced annually to reach zero in 2018. (Sirikeratikul, 2015)

### **2.3 Branding and Promotion on Fresh Fruit**

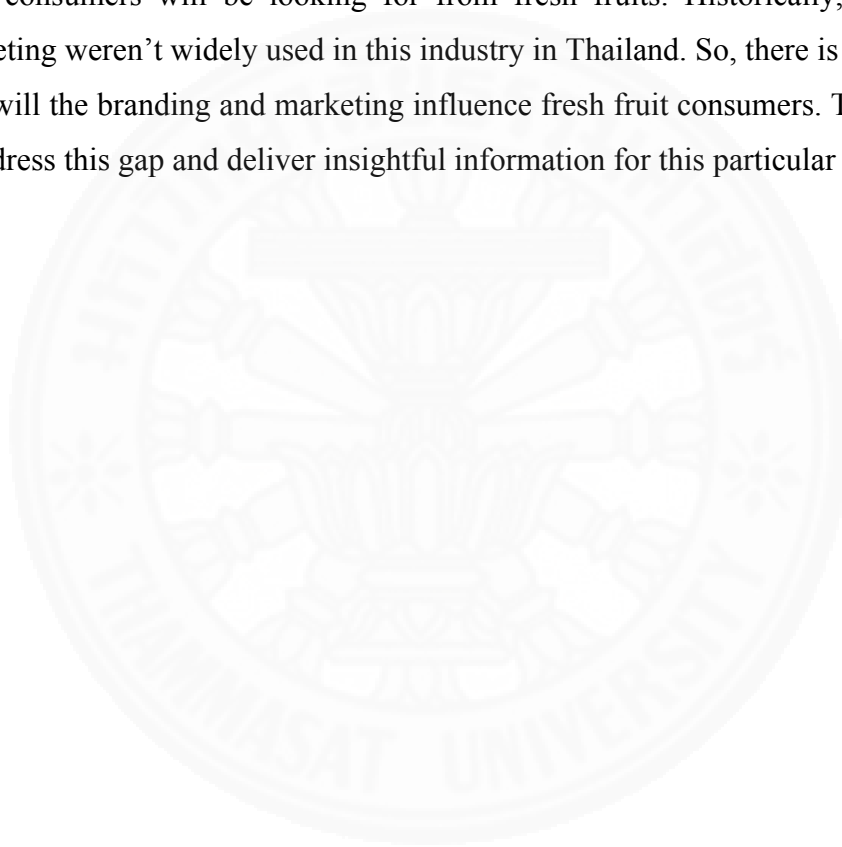

The need for branding is acknowledged by producers of fresh produces in many important producing countries. They have been building brand awareness through good use of marketing tools. For example, Eureka Blueberry is the new variety of Blueberry, which has superior flavor and crunchiness that suits Thai consumer's preference. Its brand awareness was successfully built among consumer though promotional activities at point of sales such as wholesale, retail and food service sector. The promotional activities include in-store demonstration, point of sale materials and selling competition across stores. (Matthew, 2017)

Many of the leading fruit brands around the globe have different approach to build the brand. For example, Zespri, Kiwifruits brand from New Zealand, was the pioneer in building brand and doing marketing campaign in Thailand. The key message that the brand consistently used was about superior nutritional value. Jazz and Envy apples used particular attribute of eating quality to be unique selling points. Jazz promoted refreshing sensation from eating an apple, whereas Envy promoted superior taste. Pink Lady apple, on the other hand, promoted overall eating quality

(taste, texture, aroma, juiciness) as the key message to consumers. Apart from this there are many other leading brands, which used different properties of the fruits to promote to consumers.

In summary, the findings have shown that fresh fruits consumption is on the verge of becoming the most prominent fresh food in Thailand. Combining with changing consumer demographic, lifestyle and retailing landscape, it can be foreseen what consumers will be looking for from fresh fruits. Historically, branding and marketing weren't widely used in this industry in Thailand. So, there is no evidence of how will the branding and marketing influence fresh fruit consumers. This study aims to address this gap and deliver insightful information for this particular industry.

## **CHAPTER 3**

### **RESEARCH METHODOLOGY**

#### **3.1 Exploratory Research**

This approach aimed to explore general information about fresh fruits in Thailand, consumers' current perception on imported fresh fruits and awareness of fresh fruit brands.

##### **3.1.1 Secondary Research**

Information regarding industry overview, demographic of consumers were gathered from published sources available online such as Thailand's customs and department of foreign trade and department of commerce of country of origins (e.g. USA, New Zealand), fresh fruit-specific magazine, previous research and study relevant to this field and, industry news report.

##### **3.1.2 In-dept interview**

In-depth interviews were conducted on two major groups of respondents, which were imported fresh fruit consumers and traders. Consumers provided information regarding brand awareness, shopping habits, purchasing behaviors and attributes commonly used for making decision to purchase any particular brand of fresh fruits, whereas traders will provide information from reseller's point of view.

- To explore attributes of imported fruits that impact their purchasing decision and to examine if any brand awareness on imported fruits before designing questionnaire
- To explore purchasing decision from resellers' point of view

## **3.2 Descriptive Research**

This research approach aimed to describe consumers in terms of their characteristics, attitudes toward fresh fruit brands. This research also evaluated an effectiveness of current communication of existing brands in the market.

### **3.2.1 Survey Questionnaire**

The survey questionnaire was conducted online with a total of 255 respondents selected from the group of current consumers. The questionnaire length of time will be approximately 10 minutes

## **3.3 Data Collecting Procedure**

### **3.3.1 Sampling Plan (sample size and recruiting plan)**

Due to the time limitation, sample selection of each focus group and questionnaire was by convenient sampling.

#### **3.3.1.1 In-depth interview**

##### **Consumers**

Who to recruit? / Participant Requirements

- 27-51 years old
- Residents in Bangkok
- Consume imported fruits at least once a week
- Currently not working in fresh agricultural produce (fruits and vegetable) industry.

Where to recruit

- From office, fitness center or use personal connection

##### **Traders/Resellers**

Who to recruit? / Participant Requirements

- Wholesaler or reseller of imported fresh fruits

Where to recruit

- Pak Klong Talard fresh market and Talardthai market

#### **3.3.1.2 Survey Questionnaire**

Who to recruit? / Participant Requirements

- 18-65 years old
- Residents in Thailand
- SES: All socioeconomic classes

- Currently not working in fresh agricultural produce (fruits and vegetable) industry.

Where to recruit

- Through Facebook page with selective criteria per participant requirement.

### 3.4 Data Analysis Plan

The analysis from the data obtained from research was analyzed using the Statistical Package for the Social Sciences (SPSS) to identify statistical data, frequencies, analysis of variance and correlation between variables. Other statistical analysis was also used if appropriate.

#### 3.4.1 Key Research Variables

Perceived quality attributes such as freshness, hygiene, safety are example of important independent variables. This study will check correlation between these attributes with dependent variables such as purchase intention and brand preference to understand the influence of each attribute.

**Table 1: Example of independent variables and dependent variables**

| <b>Independent variable (IV)</b> | <b>Dependent variable (DV)</b> |
|----------------------------------|--------------------------------|
| 1. Perceived quality             | 1. Purchase Intention          |
| 2. Demographic                   | 2. Brand awareness             |

### 3.4.2 Dummy Table

Demographic information was collected and statistically analyzed to understand respondents' profile and behavior.

**Table 2: Dummy Table**

| Characteristics      | Data   |
|----------------------|--|
| 1. Age (years)       | Mean, Standard Deviation, Range                                    |
| 2. Gender            | N% of each gender  |
| 3. Occupation        | Housewife, Office worker, Freelance, Trainer, Unemployed           |
| 4. Purchase Location | Fresh market, Supermarket, Traditional retailers, Modern retailers |

## **CHAPTER 4**

### **RESULTS AND DISCUSSION**

#### **4.1 Consumer In-depth Interview**

It was conducted October 25 and 26 on the total number of 4 interviewees who live in Bangkok and purchase imported fruits at least once a week. Three females (ages 27, 33, 51) and works as freelance trainer, office worker and housewife respectively. One male (age 29) and work in family business and does cross fit as hobby. The objectives are to explore attributes of imported fruits that impact their purchasing decision and to examine if any brand awareness on imported fruits before designing questionnaire.

##### **4.1.1 Sample Results**

- All four interviewees said that the quality and freshness of fruits at the point of purchase is the most important attribute.
- Two interviewees said that brand is not significant factor when buying imported fruits except for some categories which one brand outperforms others in term of availability and visibility to them.
- Three interviewees said that they exclusively buy imported fruits from a few if not one seller. Primary reason is confidence in seller's selection.

**Problems**

- Only one out of four interviewees recognize at least four out of six brands that were shown to them for checking awareness. This indicates that imported fruit brands are quite unknown.
- There are only two brands from six brands that all interviewees recognize. Both brands produced more than just imported fruits (e.g. dried fruits, canned fruits, local fruits, juice). It's difficult to justify if the awareness is due to imported fruits or other products.
- Interviewees recognize some brands, but do not know their proposition and what unique benefit those brands offer to consumers.

**Solutions**

- Reviewing the criteria for selecting brands to use in questionnaire.
- Showing the products picture associated with brand picture to respondents in questionnaire to ensure accuracy of response on brand of imported fruits.
- Conducting more in-depth interviews: (a) Passively find out more brands of imported fruits that Thai consumers are aware of. (b) Selecting different sample based on purchasing location to explore further on impact on purchasing decision from distribution channel. (c) Observing current behavior of consumer at the point of purchasing. (d) Interviewing reseller to obtain insight on brand from reseller's perspectives.

## **4.2 Traders or Resellers In-depth Interview**

It was conducted November 25 on two purchasers or resellers recruited from wholesale market. Two purchasers recruited from wholesale market are male aged 41 years old and female aged 38 years old. The male is the reseller from fresh market in South Bangkok. The female is the juice shop owner. The objectives are to explore purchasing decision from resellers' point of view. The result will be analyzed together with previous interview on final consumers for designing questionnaire

### **4.2.1 Sample Results**

- Both interviewees repeatedly purchase same brand if available, unless there is significant difference in price between one brand and another.
- One interviewee mentioned that the renowned brand tends to have more consistent quality. This makes it easy to resell to their customers.
- One interviewee said that the visual of products such as packaging, name, logo also has dramatic impact on their customer's purchasing decision.

### **Problems**

- Many findings indicate that the purchasing decision is made by perceived attributes, which are difficult to quantify.
- Information about consumers obtained from the interviewees came from resellers not consumers themselves. It may not be accurate.

### **Solutions**

- Classify perceived attributes into a group of few attributes, set up parameter for measuring their importance in questionnaire in order to quantify the result.
- Validate the claims about consumers obtained from resellers.

### 4.3 Survey Questionnaire

#### 4.3.1 Respondents Profile

The survey questionnaire was conducted online from 8 to 22 January 2018 with total respondent of 255 respondents. However, only 181 respondents completed the questionnaire. To qualify, respondents were required to regularly consuming imported fresh fruits at least once a month. As a result, 34 respondents were abandoned because their consumption is not frequent enough to provide justifiable answers to the survey questions.

The consumption frequency of 181 respondents was classified into five frequency; less than once a month, once a month, once a week, more than once a week and everyday.

**Table 3: Brand consumption frequency of respondents**

| Consumption frequency  | n   | Percentage |
|------------------------|-----|------------|
| Less than once a month | 34  | 19%        |
| Once a month           | 62  | 34%        |
| Once a week            | 35  | 19%        |
| More than once a week  | 43  | 24%        |
| Everyday               | 7   | 4%         |
| Total                  | 181 | 100%       |

**Age:** average age of respondents are 34.86 years old. The oldest age is 64 years old, while the youngest is 18 years old. The standard deviation is 10.80 years. Majority of respondents' age were between 18 to 30 years old. The number of respondents in each age range is illustrated in table below.

**Table 4: Age range of respondents**

| Age range | n  |
|-----------|----|
| 18-30     | 73 |
| 31-40     | 33 |
| 41-50     | 26 |
| 51-60     | 12 |
| 61-65     | 3  |

**Gender:** 72% of respondents are female and 28% of respondents are male.

**Occupation:** Majority of respondents are office workers, followed by housewife, business owner and students.

**Table 5: Occupation of respondents**

| Occupation     | n  | Percentage |
|----------------|----|------------|
| Housewife      | 21 | 14%        |
| Office workers | 58 | 39%        |
| Students       | 16 | 11%        |
| Business owner | 18 | 12%        |
| Unemployed     | 9  | 6%         |
| Others         | 25 | 17%        |

**Purchasing Habit:** 71% of respondents purchase imported fresh fruits by themselves. The other 29% have other purchase for them, which are mostly by family members (91%). The most common channel that respondents bought imported fresh fruits from are Supermarket (85%), follow by Hypermarket and Fresh market.

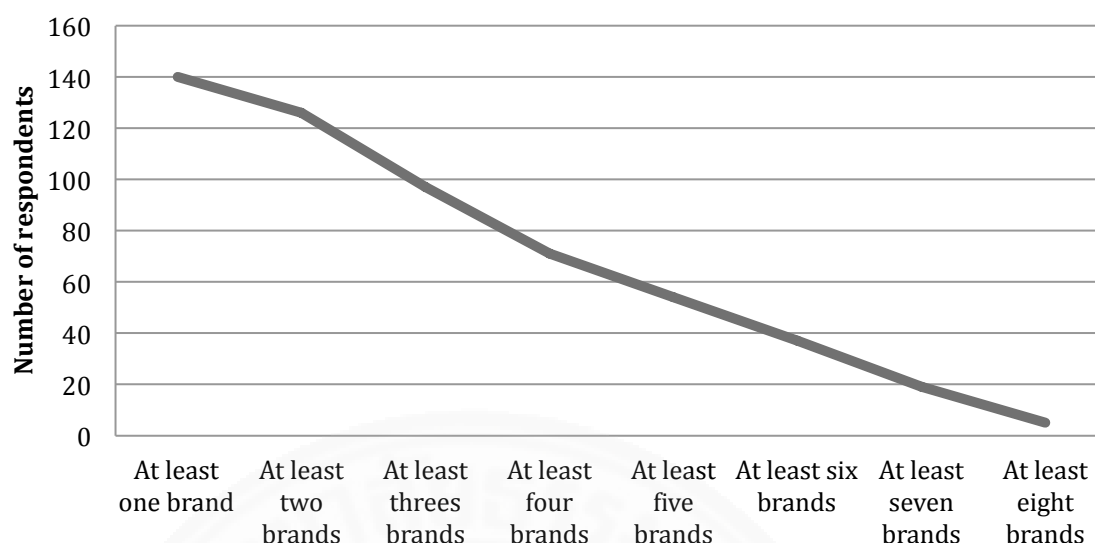

**Table 6: Purchasing channels of respondents**

| Channel          | n  | Percentage |
|------------------|----|------------|
| Supermarket      | 88 | 85%        |
| Hypermarket      | 39 | 38%        |
| Fresh market     | 25 | 24%        |
| Wholesale market | 8  | 8%         |
| Online shop      | 8  | 8%         |
| Other channels   | 3  | 3%         |

#### 4.3.2 Brand Awareness

There were nine brands that were asked about awareness in the questionnaire. These are the nine brands that were mentioned at least by two respondents during in-depth interview.

There were 140 respondents who recognize at least one brand. Only five respondents recognize eight brands. None recognizes all nine brands.

**Figure 1: Number of respondents recognizing at least one brand to eight brands**

Dole is the top brand when it comes to awareness with 78%. Cityfresh and Zespri come in at second and third place with 53% and 52% awareness respectively.

**Table 7: Brand awareness**

| Brand      | n   | %   |
|------------|-----|-----|
| Zespri     | 76  | 52% |
| Pink Lady  | 50  | 34% |
| Jazz       | 53  | 36% |
| Envy       | 67  | 46% |
| Cityfresh  | 78  | 53% |
| Dole       | 115 | 78% |
| Driscoll's | 30  | 20% |
| Sunkist    | 73  | 50% |
| Avanza     | 7   | 5%  |

The method of how respondents get introduced to the brands vary from respondents to respondents. There are four key methods which are seeing at point of sale, touching through media, receiving friends' recommendation and being given by other people. The most common one for all brands are seeing the brand at the point of sales, which account to more than 80% of most brands. Zespri and Jazz performed well in media as there is over 25% of awareness obtained through this channel.

However, the respondents' awareness is verified by ability to identify the type(s) of fruits that each brand offers. The respondents who are able to correctly identify the type of fruits have "true awareness" of the brand.

**Table 8: True brand awareness**

| <b>Brand</b> | <b>n</b> | <b>%</b>   |
|--------------|----------|------------|
| Zespri       | 66       | 45%        |
| Pink Lady    | 39       | 27%        |
| Jazz         | 46       | 31%        |
| Envy         | 59       | 40%        |
| Cityfresh    | 73       | 50%        |
| Dole         | 78       | <b>53%</b> |
| Driscoll's   | 30       | 20%        |
| Sunkist      | 68       | 46%        |
| Avanza       | 3        | <b>2%</b>  |

By comparing the awareness with true awareness, we found out that despite having the highest awareness among respondents, Dole received considerably lower true awareness, meaning that many respondents do not have complete knowledge about what kind of fruit(s) Dole offers. On the other hands, all respondents who recognize Driscoll's are fully aware of types of fruit that the brand offers.

**Table 9: Difference between awareness and true awareness of each brand**

| <b>Brand</b> | <b>Awareness</b> | <b>True Awareness</b> | <b>Difference</b> |
|--------------|------------------|-----------------------|-------------------|
| Zespri       | 52%              | 45%                   | 7%                |
| Pink Lady    | 34%              | 27%                   | 7%                |
| Jazz         | 36%              | 31%                   | 5%                |
| Envy         | 46%              | 40%                   | 5%                |
| Cityfresh    | 53%              | 50%                   | 3%                |
| Dole         | 78%              | 53%                   | <b>25%</b>        |
| Driscoll's   | 20%              | 20%                   | <b>0%</b>         |
| Sunkist      | 50%              | 46%                   | 3%                |
| Avanza       | 5%               | 2%                    | 3%                |

### 4.3.3 Brand Consumption

Out of the respondents with true awareness, Avanza and Zespri hold the highest consumption with over 90% conversion rate to consumption, whereas Cityfresh has the lowest conversion rate.

**Table 10: Brand consumption and conversion rate from awareness**

| <b>Brand</b> | <b>Frequency</b> | <b>Conversion rate%</b> |
|--------------|------------------|-------------------------|
| Zespri       | 62               | <b>94%</b>              |
| Pink Lady    | 33               | 85%                     |
| Jazz         | 40               | 87%                     |
| Envy         | 53               | 90%                     |
| Cityfresh    | 57               | <b>78%</b>              |
| Dole         | 78               | 100%                    |
| Driscoll's   | 26               | 87%                     |
| Sunkist      | 56               | 82%                     |
| Avanza       | 3                | <b>100%</b>             |

#### 4.3.4 Important Attributes

There are four key attributes that influence purchasing decision of imported fresh fruits; freshness, nutritional level, appearance and safety of the product. These were obtained from in-depth interview. These factors are quantified through survey questionnaire. Mean score indicates the level of importance of each attribute. Freshness is the most important attributes among 147 respondents. The score is in the scale of four. According to the result, the most important attribute is freshness with the highest mean score (3.77), followed by Safety (3.59) and Nutritional Value (3.29). The least important attribute is Appearance (3.11).

**Table 11: Important attributes**

| <b>Attributes</b> | <b>Mean</b> | <b>Standard Deviation</b> |
|-------------------|-------------|---------------------------|
| Freshness         | 3.77        | 0.42                      |
| Nutritional value | 3.29        | 0.63                      |
| Appearance        | 3.11        | 0.7                       |
| Safety            | 3.59        | 0.56                      |

#### 4.3.4.1 Correlation

Among the four attributes, there are four pairs of positive correlation; Freshness and Safety, Nutritional value and Appearance, Nutritional value and Safety, Appearance and Safety.

**Table 12: Correlation between attributes**

|                          |                     | <b>Freshness</b> | <b>Nutritional value</b> | <b>Appearance</b> | <b>Safety</b> |
|--------------------------|---------------------|------------------|--------------------------|-------------------|---------------|
| <b>Freshness</b>         | Pearson Correlation | 1                | 0.05                     | 0.131             | .207*         |
|                          | Sig. (2-tailed)     |                  | 0.549                    | 0.113             | 0.012         |
|                          | N                   | 147              | 147                      | 147               | 147           |
| <b>Nutritional value</b> | Pearson Correlation | 0.05             | 1                        | .251**            | .379**        |
|                          | Sig. (2-tailed)     | 0.549            |                          | 0.002             | 0             |
|                          | N                   | 147              | 147                      | 147               | 147           |
| <b>Appearance</b>        | Pearson Correlation | 0.131            | .251**                   | 1                 | .219**        |
|                          | Sig. (2-tailed)     | 0.113            | 0.002                    |                   | 0.008         |
|                          | N                   | 147              | 147                      | 147               | 147           |
| <b>Safety</b>            | Pearson Correlation | .207*            | .379**                   | .219**            | 1             |
|                          | Sig. (2-tailed)     | 0.012            | 0                        | 0.008             |               |
|                          | N                   | 147              | 147                      | 147               | 147           |

\* Correlation is significant at the 0.05 level (2-tailed).

\*\* Correlation is significant at the 0.01 level (2-tailed).

#### 4.3.5 Segmentation

We can segment respondents into two groups by using cluster analysis in SPSS on score of each attribute given by individual respondent. As a result of cluster analysis, there are two segments of respondents, casual consumers and health-conscious consumers.

| Cluster/Segment            | n   | Percentage |
|----------------------------|-----|------------|
| Casual consumers           | 101 | 69%        |
| Health-conscious consumers | 46  | 31%        |

Both segments similarly consider importance of freshness and safety. The distinct differences between the two are nutritional value and appearance.

Casual consumers consider the appearance of fresh fruits relatively more than health-conscious consumers. On the other hand, health-conscious consumers concern about nutritional value considerably more than casual consumers.

**Figure 2: Important attributes by segments**

One-way ANOVA was used to test if there was statistically significant difference between the two segments on level of importance given to nutritional value and appearance. The result of nutritional value and appearance were statistically significant.

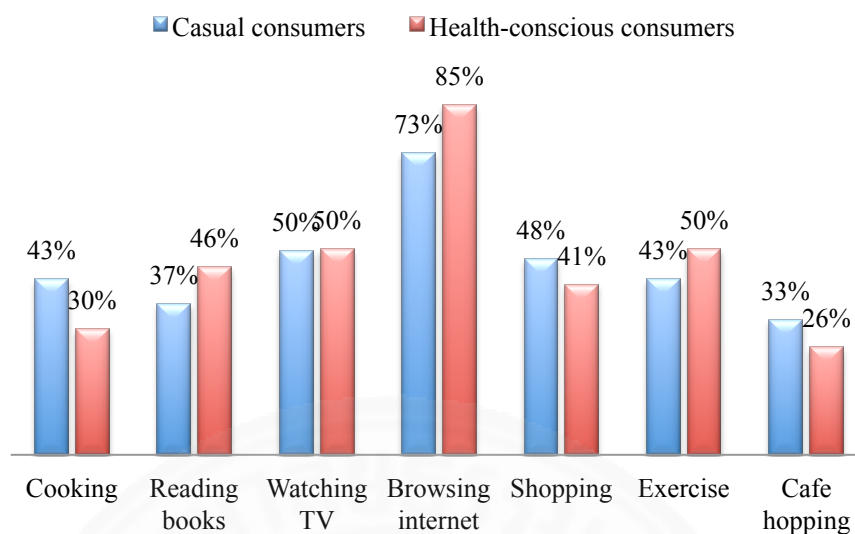

**Table 13: ANOVA table – difference on important attributes by segments**

| ANOVA             |                | Sum of Squares | df  | Mean Square | F       | Sig.  |
|-------------------|----------------|----------------|-----|-------------|---------|-------|
| Freshness         | Between Groups | 0.004          | 1   | 0.004       | 0.023   | 0.88  |
|                   | Within Groups  | 26.132         | 145 | 0.18        |         |       |
|                   | Total          | 26.136         | 146 |             |         |       |
| Nutritional value | Between Groups | 4.979          | 1   | 4.979       | 13.508  | 0     |
|                   | Within Groups  | 53.443         | 145 | 0.369       |         |       |
|                   | Total          | 58.422         | 146 |             |         |       |
| Appearance        | Between Groups | 32.413         | 1   | 32.413      | 117.954 | 0     |
|                   | Within Groups  | 39.845         | 145 | 0.275       |         |       |
|                   | Total          | 72.259         | 146 |             |         |       |
| Safety            | Between Groups | 0.244          | 1   | 0.244       | 0.781   | 0.378 |
|                   | Within Groups  | 45.266         | 145 | 0.312       |         |       |
|                   | Total          | 45.51          | 146 |             |         |       |

#### 4.3.5.1 Lifestyle of Segments

Lifestyle is defined by activities that respondents like to do as hobby. Browsing internet is the most common activities with 73% and 85% for causal consumers and health-conscious consumers respectively. Some of the notable differences between two groups are cooking, reading books, exercise and café hopping.

**Figure 3: Hobby by segments**

#### 4.3.5.2 Purchase Locations of each segment

The main purchase locations of both segments are supermarket. However, most casual consumers purchase from several channels, while health-conscious consumers purchase from single location.

**Table 14: Purchase location of each segment**

| Purchase Location              | Casual Consumers | Health-conscious Consumers |
|--------------------------------|------------------|----------------------------|
| Purchase from fresh market     | 24%              | 13%                        |
| Purchase from wholesale market | 9%               | 3%                         |
| Purchase from supermarket      | 87%              | 45%                        |
| Purchase from hypermarket      | 39%              | 19%                        |
| Purchase from online shop      | 9%               | 3%                         |

### 4.3.6 Perceived Quality of The Brands

The brands' perceived quality is measured by the score (scale of four) of the five quality attributes given by the consumers of each brand, which are freshness, nutritional value, appearance, safety and deliciousness. Deliciousness is added into the equation because this is the score from the respondents who have experience consuming fruits from the specific brand. The results of each brand are illustrated in bar chart below. Avanza was removed from this analysis due to insufficient samples that are aware of the brand.

**Figure 4: Perceived quality of each brand**

The three brands with the highest overall score are Driscoll's, Envy and Cityfresh which have at least three attributes with score higher than 3.0. Among all brands, nutritional value is the attribute with the lowest score, which indicates that none of these brands stand out in term of providing superior nutritional value than others.

#### 4.3.6.1 Perceived Quality by Segments

When looking at each perceived quality of each brand by segment, there are several differences. Table below illustrate perceived quality of each segment on each brand.

**Table 15: Perceived quality by segments**

| Brand     | Attribute         | Segment          |                            |
|-----------|-------------------|------------------|----------------------------|
|           |                   | Casual consumers | Health-conscious consumers |
| Zespri    | Freshness         | 2.86             | 2.76                       |
|           | Nutritional Value | 2.53             | 2.32                       |
|           | Appearance        | 2.96             | 2.84                       |
|           | Safety            | 2.88             | 2.72                       |
|           | Deliciousness     | 2.78             | 2.52                       |
| Pink Lady | Freshness         | 2.86             | 2.67                       |
|           | Nutritional Value | 2.71             | 2.47                       |
|           | Appearance        | 2.97             | 2.73                       |
|           | Safety            | 2.83             | 2.6                        |
|           | Deliciousness     | 2.83             | 2.87                       |
| Jazz      | Freshness         | 2.78             | 2.71                       |
|           | Nutritional Value | 2.53             | 2.29                       |
|           | Appearance        | 2.83             | 2.71                       |
|           | Safety            | 2.81             | 2.47                       |

|            |                   |      |      |
|------------|-------------------|------|------|
| Dole       | Freshness         | 2.77 | 2.71 |
|            | Nutritional Value | 2.58 | 2.55 |
|            | Appearance        | 2.92 | 2.9  |
|            | Safety            | 2.89 | 2.77 |
|            | Deliciousness     | 2.75 | 2.61 |
| Driscoll's | Freshness         | 3.29 | 3    |
|            | Nutritional Value | 2.83 | 2.5  |
|            | Appearance        | 3.29 | 2.83 |
|            | Safety            | 3.17 | 2.83 |
|            | Deliciousness     | 3.21 | 2.67 |
| Sunkist    | Freshness         | 2.89 | 2.89 |
|            | Nutritional Value | 2.73 | 2.61 |
|            | Appearance        | 3    | 2.89 |
|            | Safety            | 2.85 | 2.61 |
|            | Deliciousness     | 2.93 | 2.89 |

One-way ANOVA was used to find out which differences are statistically significant. Zespri, Jazz and Envy are the three brands which perceived quality of the two segments on certain attributes are statistically significantly different.

Zespri → Deliciousness

Jazz → Safety

Envy → Freshness and Deliciousness

**Table 16: ANOVA table – difference in perceived quality by segments**

| Anova               |                | Sum of Squares | df | Mean Square | F     | Sig.   |
|---------------------|----------------|----------------|----|-------------|-------|--------|

| Envy is fresh     | Between Groups | 1.871  | 1  | 1.871 | 5.963 | *0.017 |
|                   | Within Groups  | 20.398 | 65 | 0.314 |       |        |
|                   | Total          | 22.269 | 66 |       |       |        |
| Envy is delicious | Between Groups | 2.937  | 1  | 2.937 | 5.946 | *0.017 |
|                   | Within Groups  | 32.108 | 65 | 0.494 |       |        |
|                   | Total          | 35.045 | 66 |       |       |        |

#### 4.3.7 Purchase Intention

The respondents provided purchase intention of the brands they had experience consuming from scale of one to five. The result is illustrated in bar chart below.

**Figure 5: Brands' purchase intention**

Zespri, Driscoll's, Envy and Cityfresh received high purchase intention from their consumers relatively to the other brands. Among all eight brands, Jazz has the lowest purchase intention.

By comparing between the two segments, casual consumers have higher purchase intention in almost every brand, except Sunkist.

**Figure 6: Brands' purchase intention by segment**

In order to know which attributes or factors have an effect on purchase intention of each brand, linear regression is used to test significant level.

The result came out that each individual brand has different predictors or significant factors that affect purchase intention. Zespri, however, had high purchase intention among all eight brands, but the current information is not sufficient to identify which factors significantly affect purchase intention of this brand.

| Brand's Purchase Intention | Predictor(s)                             |
|----------------------------|--|
| Zespri                     | -  |
| Pink Lady                  | Appearance, Safety                       |
| Jazz                       | Freshness                                |
| Envy                       | Freshness, Safety                        |
| Cityfresh                  | Freshness, Nutritional Value, Appearance |
| Dole                       | Freshness, Safety                        |
| Driscoll's                 | Deliciousness                            |
| Sunkist                    | Freshness, Appearance, Safety            |

**4.3.8 Media**

Point of sale is the dominant media channel to reach consumers with outnumbered other media by big margin. Apart from point of sale, Jazz, Dole and Sunkist have relatively reach consumers through television than other brands with more than 10% of respondents saw the advertisement.

Another notable channel is Facebook which Cityfresh, Zespri and Pink Lady receive high reaches with 51%, 17% and 16% respectively which implies that these three brands emphasize on promoting on this channel more than other brands.

**Figure 7: Media exposure by each brand’s consumers**

## CHAPTER 5

### CONCLUSIONS AND RECOMMENDATIONS

#### 5.1 Conclusion and Recommendations

##### 5.1.1 Influence of Branding and Marketing on Perceived Quality

According to research result, branding of imported fresh fruits create recognition to consumers. Despite being commodity product, many fresh fruit brands received more than 50% awareness from respondents. However, some brands failed to acknowledge customers what products they offer. These brands need to enhance its identity in its communication to eliminate this problem and obtain true awareness from customers. The result also shows that the conversion from awareness to consumption is high with 80% or more in all brands. Therefore, it can be concluded that consumers are likely to buy the products once they have awareness of the brand.

However, an influence on consumers' perceived quality is not significant. It is found that important factors for purchase intention of each brand do not match with the message each brand delivered.

| <b>Brands</b> | <b>Focused Attributes in Brand Communication</b> | <b>Significant Attributes from Regression</b> |
|---------------|--|---|
| Zespri        | Nutritional Value                                | -   |
| Pink Lady     | Deliciousness                                    | Appearance & Safety                           |
| Jazz          | Deliciousness                                    | Freshness                                     |
| Envy          | Deliciousness                                    | Freshness & Safety                            |
| Cityfresh     | Freshness  | Freshness, Nutritional Value, Appearance      |
| Dole          | Nutritional Value                                | Freshness & Safety                            |
| Driscoll's    | Freshness, Deliciousness                         | Deliciousness                                 |
| Sunkist       | -  | Freshness & Appearance & Safety               |

This mismatching indicates that some brands did not promote on the attributes that get customers to buy the products.

### **5.1.2 Key Attributes for Targeting**

The key attributes of each of the two segments differ. Casual consumers require good appearance product, where Health-conscious consumers do not require at the same level, but look for nutritional benefits instead. Therefore, the brands can target the consumers who look for attributes that fit with what the brands offer. Pink Lady and Sunkist can target casual consumers because appearance is an important attribute of the brands. However, Cityfresh can target either one of the two segments because this brand has both nutritional value and freshness as important attributes.

### **5.1.3 Key Elements for Effective Communication**

To effectively obtain casual consumers, whose appearance of the fruits is important, the brand communication should be emphasizing on the beauty of the fruits, showing attractive pictures. An example of recommended brand communication is in **Appendix D**. On the other hand, health-conscious consumers should emphasize on providing nutritional benefits of fruits. An example of recommended brand communication is in **Appendix E**.

## **5.2 Research Limitations**

Branding on fresh fruits is new for Thai consumers. Many consumers, despite having awareness of the brands, admitted that brand is not important factors for their purchase decision. Therefore, the attribute score obtained from the research are not purely perceived quality but from the experience of consuming the products. As a result of this, the key attributes of each brand in consumers' perspective are different from the brands' perspective.

Some of the brands in this research offer several product categories that lead to inconsistency information from respondents if they know the brands for different kinds of product categories.

As a result of this, many respondents struggle to provide information about what brands did they consider or evaluate for purchasing, making the decision making process obtained from this research lackluster.

## **5.2 Suggestion for Future Research**

The sampling method can be changed to probability sampling to enhance accuracy of result and narrow down the respondents to those who consider brands as important attributes when purchasing fresh fruits. These respondents are potentially more capable to give quality information than those who do not consider brands.
